

Assignment 2.4 - Jake Seever

For my portfolio project I have chosen to take more influence from the portfolio example researched last week from Devon Stark. I think this approach will work well for a single page application. I also think this style will translate well to a mobile platform. I will be using the Bootstrap framework and will create a responsive design. I think that with the layout I have chosen I can get a lot of information on the single page without over cluttering or over saturating the user with information. It will scroll vertically from section to section following a similar pattern with alternating background colors/images per section. I will have sections listing information about me, projects that I have done, potentially my resume, contact information and some professional yet fun pictures. I will have navigation links near the top to jump to the different sections of the page. I also plan to use the majority of the horizontal screen space available. I also plan to use views to change content in sections where needed. With this approach I can give users access to more information if they desire while still maintaining a single page design.
